

The Semantic Web: Ontologies and OWL

Ian Horrocks and Alan Rector

Introduction to the Semantic Web

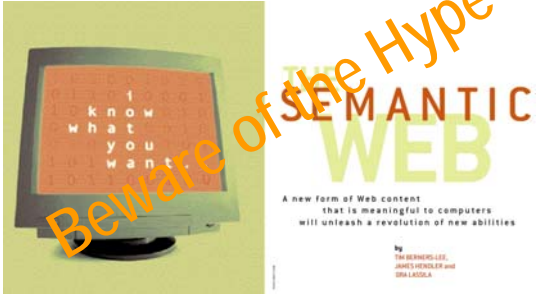

History of the Semantic Web

- Web was “invented” by **Tim Berners-Lee** (amongst others), a physicist working at CERN
- TBL’s original vision of the Web was much more ambitious than the reality of the existing (syntactic) Web:

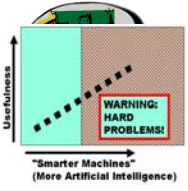

“... a goal of the Web was that, if the interaction between person and hypertext could be so intuitive that the machine-readable information space gave an accurate representation of the state of people’s thoughts, interactions, and work patterns, then machine analysis could become a very powerful management tool, seeing patterns in our work and facilitating our working together through the typical problems which beset the management of large organizations.”
- TBL (and others) have since been working towards realising this vision, which has become known as the **Semantic Web**
 - E.g., article in May 2001 issue of Scientific American...

Scientific American, May 2001:

Beware of the Hype

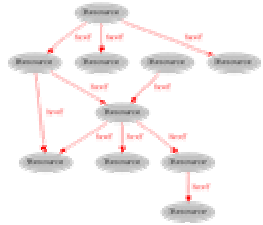

- Hype seems to suggest that Semantic Web means: “semantics + web = AI”
 - “A new form of Web content that is meaningful to computers will unleash revolution of new abilities”
- More realistic to think of it as meaning “semantics + web + AI = more useful web”
 - Realising the complete “vision” is too hard for now (probably)
 - But we can make a start by adding **semantic annotation** to web resources

Where we are Today: the Syntactic Web

[Hendler & Miller 02]

The Syntactic Web is...

- **A hypermedia, a digital library**
 - A library of documents called (web pages) interconnected by a hypermedia of links
- **A database, an application platform**
 - A common portal to applications accessible through web pages, and presenting their results as web pages
- **A platform for multimedia**
 - BBC Radio 4 anywhere in the world! Terminator 3 trailers!
- **A naming scheme**
 - Unique identity for those documents

A place where computers do the presentation (easy) and people do the linking and interpreting (hard).

Why not get computers to do more of the hard work?

[Goble 03]

Hard Work using the Syntactic Web...

Find images of Peter Patel-Schneider, Frank van Harmelen and Alan Rector...

Rev. Alan M. Gates, Associate Rector of the Church of the Holy Spirit, Lake Forest, Illinois

Impossible (?) using the Syntactic Web...

- **Complex queries involving background knowledge**
 - Find information about “animals that use sonar but are not either bats or dolphins”, e.g., Barn Owl
- **Locating information in repositories**
 - Travel enquiries
 - Prices of goods
 - Results of human experiments
- **Finding and using “agents”**
 - Visualise surface between two proteins
- **Delegating complex tasks to agents**
 - Book me a holiday somewhere warm, not too far away, and speak French or English

What is the Problem?

- Consider a typical web page:

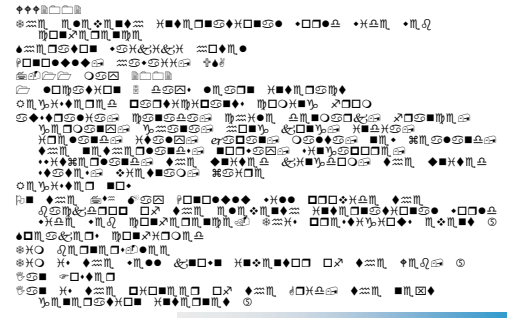

- Markup consists of:
 - rendering information (e.g., font size and colour)
 - Hyper-links to related content
- Semantic content is accessible to humans but not (easily) to computers...

What information can we see...

WWW2002
 The eleventh international world wide web conference
 Sheraton waikiki hotel
 Honolulu, hawaii, USA
 7-11 may 2002
 1 location 5 days learn interact
 Registered participants coming from
 australia, canada, chile denmark, france, germany, ghana, hong kong, india, ireland, italy, japan, malta, new zealand, the netherlands, norway, singapore, switzerland, the united kingdom, the united states, vietnam, zaire

Register now
 On the 7th May Honolulu will provide the backdrop of the eleventh international world wide web conference. This prestigious event ...
 Speakers confirmed
 Tim berners-lee
 Tim is the well known inventor of the Web, ...
 Ian Foster
 Ian is the pioneer of the Grid, the next generation internet ...

What information can a machine see...

Ontology in Computer Science

- An ontology is an engineering artifact:
 - It is constituted by a specific vocabulary used to describe a certain reality, plus
 - a set of explicit assumptions regarding the intended meaning of the vocabulary.
- Thus, an ontology describes a formal specification of a certain domain:
 - Shared understanding of a domain of interest
 - Formal and machine manipulable model of a domain of interest

“An explicit specification of a conceptualisation”
[Gruber93]

Structure of an Ontology

Ontologies typically have two distinct components:

- Names for important concepts in the domain
 - **Elephant** is a concept whose members are a kind of animal
 - **Herbivore** is a concept whose members are exactly those animals who eat only plants or parts of plants
 - **Adult_Elephant** is a concept whose members are exactly those elephants whose age is greater than 20 years
- Background knowledge/constraints on the domain
 - **Adult_Elephants** weigh at least 2,000 kg
 - All **Elephants** are either **African_Elephants** or **Indian_Elephants**
 - No individual can be both a **Herbivore** and a **Carnivore**

A Semantic Web — First Steps

Make web resources more accessible to automated processes

- Extend existing rendering markup with **semantic markup**
 - Metadata annotations that describe content/function of web accessible resources
- Use Ontologies to provide **vocabulary** for annotations
 - “Formal specification” is accessible to machines
- A prerequisite is a standard web ontology language
 - Need to agree common **syntax** before we can share semantics
 - Syntactic web based on **standards** such as **HTTP** and **HTML**

Ontology Design and Deployment

- Given key role of ontologies in the Semantic Web, it will be essential to provide **tools** and **services** to help users:
 - Design and maintain high quality ontologies, e.g.:
 - **Meaningful** — all named classes can have instances
 - **Correct** — captured intuitions of domain experts
 - **Minimally redundant** — no unintended synonyms
 - **Richly axiomatised** — (sufficiently) detailed descriptions
 - Store (large numbers) of **instances** of ontology classes, e.g.:
 - Annotations from web pages
 - Answer **queries** over ontology classes and instances, e.g.:
 - Find more general/specific classes
 - Retrieve annotations/pages matching a given description
 - **Integrate** and align multiple ontologies

Example Ontology
